

Testimonial Report on Feeding Celmanax[®] at the Dairy of Keith Rahm, Colby WI.

Keith Rahm, Owner

Prior to using Celmanax[®], we were experiencing some issues with Salmonella and Clostridia in the transition cows. Early this spring we put all the early dry cows, prefresh cows and fresh cow pen on Celmanax. The fresh cow pen ranged from 1 to about 30 days in milk.

Within two weeks from starting on the product we stopped having these issues. These animals are still on the product and there have been no reoccurrences of either Salmonella or Clostridia.

I have recently put the entire milking herd on Celmanax.
